## Section 5.4: Integration Formulas and the Net Change Theorem

In this section, we use some basic integration formulas studied previously to solve some key applied problems.

### Basic Integration Formulas

Recall the integration formulas given in table in Antiderivatives (Section 4.10) and the rule on properties of definite integrals.

**Media:** Watch this [video](#) example on definite integrals.

### Examples

- 1) Use the power rule to integrate the function  $\int_1^4 \sqrt{t}(1+t)dt$ .

$$\begin{aligned}\int_1^4 \sqrt{t}(1+t) dt &= \int_1^4 t^{\frac{1}{2}}(1+t) dt = \int_1^4 \left(t^{\frac{1}{2}} + t^{\frac{3}{2}}\right) dt \\&= \left.\frac{2}{3}t^{\frac{3}{2}} + \frac{2}{5}t^{\frac{5}{2}}\right|_1^4 \\&= \left[\frac{2}{3}(4)^{\frac{3}{2}} + \frac{2}{5}(4)^{\frac{5}{2}}\right] - \left[\frac{2}{3}(1)^{\frac{3}{2}} + \frac{2}{5}(1)^{\frac{5}{2}}\right] \\&= \frac{256}{15}\end{aligned}$$

- 2) Find the definite integral of  $f(x) = x^2 - 3x$  over the interval  $[1,3]$ .

$$\begin{aligned}\int_1^3 (x^2 - 3x) dx &= \left.\frac{1}{3}x^3 - \frac{3}{2}x^2\right|_1^3 \\&= \left[\frac{1}{3}(3)^3 - \frac{3}{2}(3)^2\right] - \left[\frac{1}{3}(1)^3 - \frac{3}{2}(1)^2\right] \\&= -\frac{10}{3}\end{aligned}$$

## The Net Change Theorem

The net change theorem considers the integral of a rate of change. Net change can be applied to area, distance, and volume, to name only a few applications.

### Net Change Theorem

The new value of a changing quantity equals the initial value plus the integral of the rate of change:

$$F(b) = F(a) + \int_a^b F'(x) dx$$

Or

$$\int_a^b F'(x) dx = F(b) - F(a).$$

**Media:** Watch this [video](#) to learn about the difference between net area and total area.

**Media:** Watch this [video](#) example on the net change theorem.

### Examples

- 1) Given a velocity function  $v(t) = 3t - 5$  (in meters per second) for a particle in motion from time  $t = 0$  to time  $t = 3$ ,
  - a. find the net displacement of the particle.

$$\begin{aligned}\int_0^3 (3t - 5) dt &= \left. \frac{3}{2}t^2 - 5t \right|_0^3 \\ &= \left[ \frac{3}{2}(3)^2 - 5(3) \right] - 0\end{aligned}$$

$$= -\frac{3}{2} \text{ meters}$$

b. Find the total distance traveled by a particle.

To find the total distance, you will need to find both the positive and negative areas (i.e., absolute value). In addition, find where the velocity function crosses the  $x$ -axis by setting the function equal to 0.

$$3t - 5 = 0$$

$$t = \frac{5}{3}$$

Total Distance:

$$\begin{aligned} \int_0^3 |v(t)| dt &= \int_0^{\frac{5}{3}} -v(t) dt + \int_{\frac{5}{3}}^3 v(t) dt \\ &= \int_0^{\frac{5}{3}} (5 - 3t) dt + \int_{\frac{5}{3}}^3 (3t - 5) dt \\ &= \left( 5t - \frac{3}{2}t^2 \right) \Big|_0^{\frac{5}{3}} + \left( \frac{3}{2}t^2 - 5t \right) \Big|_{\frac{5}{3}}^3 \\ &= \left[ 5\left(\frac{5}{3}\right) - \frac{3}{2}\left(\frac{5}{3}\right)^2 \right] - 0 + \left[ \frac{3}{2}(3)^2 - 5(3) \right] - \left[ \frac{3}{2}\left(\frac{5}{3}\right)^2 - 5\left(\frac{5}{3}\right) \right] \\ &= \frac{41}{6} \text{ meters} \end{aligned}$$

- 2) If the motor on a motorboat is started at  $t = 0$  and the boat consumes gasoline at a rate of  $5 - t^3 \frac{\text{gal}}{\text{hr}}$ , how much gasoline is used in the first two hours?

$$\begin{aligned} \int_0^2 (5 - t^3) dt &= \left( 5t - \frac{t^4}{4} \right) \Big|_0^2 \\ &= \left[ 5(2) - \frac{(2)^4}{4} \right] - 0 \\ &= 6 \text{ gallons of gas in 2 hours} \end{aligned}$$

## Integrating Even and Odd Functions

Recall that the graphs of even functions are symmetric about the  $y$ -axis. An odd function is symmetric about the origin. Integrals of even functions, when the limits of integration are from  $-a$  to  $a$ , involve two equal areas, because they are symmetric about the  $y$ -axis. Integrals of odd functions, when the limits of integration are similarly  $[-a, a]$ , evaluate to zero because the areas above and below the  $x$ -axis are equal.

### Integrals of Even and Odd Functions

For continuous even functions such that  $f(-x) = f(x)$ ,

$$\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx.$$

For continuous odd functions such that  $f(-x) = -f(x)$ ,

$$\int_{-a}^a f(x) dx = 0.$$

**Media:** Watch this [video](#) example on integrals of an even function.

**Media:** Watch this [video](#) example on integrals of an odd function.

### Examples

- 1) Integrate the even function  $\int_{-2}^2 (3x^8 - 2) dx$  and verify that the integration formula for even functions holds.

$$\begin{aligned}\int_{-2}^2 (3x^8 - 2) dx &= \left( 3 \cdot \frac{x^9}{9} - 2x \right) \Big|_{-2}^2 \\ &= \left[ \frac{(2)^9}{3} - 2(2) \right] - \left[ \frac{(-2)^9}{3} - 2(-2) \right] \\ &= \frac{1000}{3}\end{aligned}$$

To verify, calculate the integral from 0 to 2 and double it.

$$\begin{aligned}\int_0^2 (3x^8 - 2) dx &= \left( 3 \cdot \frac{x^9}{9} - 2x \right) \Big|_0^2 \\ &= \left[ \frac{(2)^9}{3} - 2(2) \right] - 0 \\ &= \frac{500}{3}\end{aligned}$$

$$\text{And } 2 \cdot \frac{500}{3} = \frac{1000}{3}$$

2) Evaluate the definite integral of the odd function  $-5 \sin x$  over the interval  $[-\pi, \pi]$ .

$$\begin{aligned}\int_{-\pi}^{\pi} -5 \sin x \, dx &= -5(-\cos x) \Big|_{-\pi}^{\pi} \\&= [-5(-\cos(\pi))] - [-5(-\cos(-\pi))] \\&= -5 - (-5) \\&= 0\end{aligned}$$
